

Abstract

[0031] A tool for adjusting string on a racket is disclosed. The tool is made up by a longitudinal body of a size comparable to that of a pen, defined by a hilt with a section that narrows at the ends, one of which is provided with a notch to push the string transversally and a hook to pull it and correct displacements in the set of strings' octagonal configuration. On the opposite side, it is provided with a notch that houses, and protects, a cutting edge to produce the necessary cuts in the string to avoid racket bending. The invention is a multi-function instrument, that may be easily carried by the player, to be used instead of the usual means that include pushing levers and cutting edges or scissors.
